ELVIA: Review and revision report

Editable scientific template, version 2026-10-23. This is a template, not a completed review or an endorsement.

> Use this template for a paper already in ELVIA. Address the exact published report/version you reserved. You may support, qualify or challenge earlier findings and add new problems. A focused response to one finding is sufficient. Replace prompts, keep source identifiers, and delete optional sections you do not use. Compile with pdfLaTeX or XeLaTeX, or upload one complete UTF-8 .tex file. Use a self-contained document without external images, input files or bibliography files; submit a self-contained PDF if those resources are essential.

Submission files

- This report: one PDF or one complete .tex file.
- The original article and main supplement are already linked. Do not upload them again in this revision route.
- Optional verification code: one ZIP or 1–10 source-code/support files, at most 5 MB total, including unpacked ZIP contents. A README with versions, commands and expected outputs is helpful; no prescribed folders are required.

Do not package the report into a ZIP. Use the report slot and optional code slot.

1 Published baseline and review scope

Paper *[Exact title, DOI or official URL, and source version inspected.]*

ELVIA baseline *[Case ID, public case URL and published revision number shown when this paper was reserved. Include the reading date.]*

Existing problems addressed *[Problem numbers and titles from that published revision. Do not renumber the earlier report's findings.]*

Review question *[What you set out to verify, support, qualify or challenge.]*

Summary *[What changes you propose and why; distinguish agreement, disagreement, clarification and unresolved evidence.]*

Scope exclusions *[Parts of the paper or prior report that you did not assess.]*

2 Response map

> Give one row for each existing problem addressed. Use Agree, Partly agree, Disagree, or Unresolved; then state the requested disposition. Website checkboxes are a convenient index, not a replacement for this reasoning. Do not use a new problem number for a response to an old problem.

Existing problem	Your position	Proposed change and report location
[n]	*[Position]*	*[Retain, clarify, revise severity, withdraw the stated concern, or leave pending; section reference.]*

3 Response to existing Problem *[n]*: *[title]*

Repeat for each existing problem addressed. Keep the original number and title even when your conclusion differs.

Earlier finding *[Faithful short quotation or paraphrase and its exact location in the prior report.]*

Paper location *[Original PDF page/section/equation/figure, or code file/lines and commit relevant to this finding.]*

Your position *[Agree, partly agree, disagree or unresolved. Explain precisely which premise, derivation, interpretation or impact statement you are assessing.]*

Assumptions *[Definitions, scope, units, parameter range and stated versus inferred conditions.]*

Independent check *[Inspectable reasoning, derivation, counterexample, calculation, data/control analysis or code check. Identify actual runs and outputs; distinguish proof, finite checks, observations and conjecture.]*

Result and counterevidence *[What the check establishes, alternative readings, contrary evidence and whether the earlier concern survives.]*

Requested revision *[Exact change to the earlier statement, reasoning, severity or status, and a replacement statement if useful.]*

Severity/outcome after this check *[Minor; Major; Needs evidence; No issue found within scope. Justify the effect on the specific scientific claim.]*

Limits *[Unresolved steps, failed attempts and what the check does not establish.]*

Major requires demonstrated impact on a central claim; Minor is a bounded local issue. Needs evidence leaves validity or impact unresolved. No issue found within scope applies only to the claim and conditions actually checked.

4 New problem N1: *[short descriptive title]* (optional)

Use N1, N2, etc. for genuinely new problems, separate from responses above. Delete this section if there are no new problems. For every new problem include all items below; do not assume disagreement with an earlier report is itself a new problem in the paper.

Location and claim *[Exact original source location and faithful claim.]*

Severity/outcome *[Minor; Major; Needs evidence; No issue found within scope.]*

Conditions and check *[Assumptions, units, complete reasoning or reproducible method, and actual evidence.]*

Impact *[Which result is affected and why the evidence supports this severity.]*

Counterevidence and limits *[Alternative readings, contrary evidence, unresolved steps and what remains outside the check.]*

Correction (optional) *[A scoped replacement or clarification, with remaining verification needs.]*

5 Reproduction and revision summary

Optional verification code *[List filenames or ZIP, versions, dependencies, commands, random seeds and tolerances if relevant, and expected versus actual results. If no code is needed, state that explicitly.]*

Changes requested *[A compact list linking each requested edit to an existing Problem number or new problem N1, N2, etc.]*

What remains unchanged *[Earlier findings not assessed, supported findings and scientific conclusions outside your scope.]*

Publication boundary *[A proposed change is not an adopted correction. Separate issue assessment, verification of a repair and author adoption.]*

6 AI assistance and contributor declaration

> AI-assisted scientific review is encouraged. Use AI to organize the report, check a derivation or inspect code, then verify the source, assumptions and outputs yourself. Do not treat model agreement as independent evidence. Manual work is equally welcome.

AI used *[Yes or no. If no, delete the AI-specific entries below.]*

Model and access *[Actual provider, model/version, interface or tool, reasoning setting, and date(s) used. Do not invent unavailable settings.]*

Assistance *[Which tasks AI performed; what text, sources or code it saw; material prompts or a concise reproducible description.]*

Human checks *[Which source passages, calculations, citations and outputs you personally verified. Identify unverified AI suggestions explicitly.]*

Conflicts and role *[Authorship, collaboration, financial or other relevant relationships; your role in this analysis.]*

Responsibility *[I checked the cited evidence and accurately described the scope, uncertainty, AI assistance and limitations of this contribution.]*

Attribution *[Contributor name or preferred credit, affiliation if relevant, and date. Do not put private contact details in the report.]*

> List only sources actually consulted. Give authors, title, year, DOI or stable URL and exact location when relevant. Brief quotations must be clearly marked. Use this self-contained bibliography; no separate .bib file is needed.

References

[1] *[Authors. Title. Venue, year. DOI or stable URL and version.]*

[2] *[Additional source actually used. Delete if not applicable.]*
